

ABSTRACT

An object of the present invention is to maintain a coating and developing system by remotely operating it more safely.

5 The present invention is a maintenance system of a substrate processing apparatus, including a remote operation unit for operating the substrate processing apparatus from a remote place by transmitting a remote operation information to a side of the substrate processing apparatus through a communication network and providing the remote operation information to
10 the substrate processing apparatus, and a communication control unit for receiving the remote operation information transmitted to the side of the substrate processing apparatus and providing the remote operation information to the substrate processing apparatus. The communication control unit provides the remote operation information to the substrate
15 processing apparatus only when there is an allow setting for the remote operation by a worker in the side of the substrate processing apparatus.
